

Cloud Computing for Online Retail

Cloud computing is ideal for online retail enterprises:

- Scalable to handle seasonal surges
- On-demand
- Service fully managed by provider
- Fast response time

How cloud computing works:

- Users' (enterprise employees') desktop computers connect to the cloud
- The cloud service provider moves data between servers to meet dynamic storage needs
- Users access data and applications from cloud servers through virtual computers
- The movement of information by the provider is invisible to the users
